Winter Recap

5.3.26

Quarter Overview

Previous idea: application to find cheapest e-commerce products (price tracking)

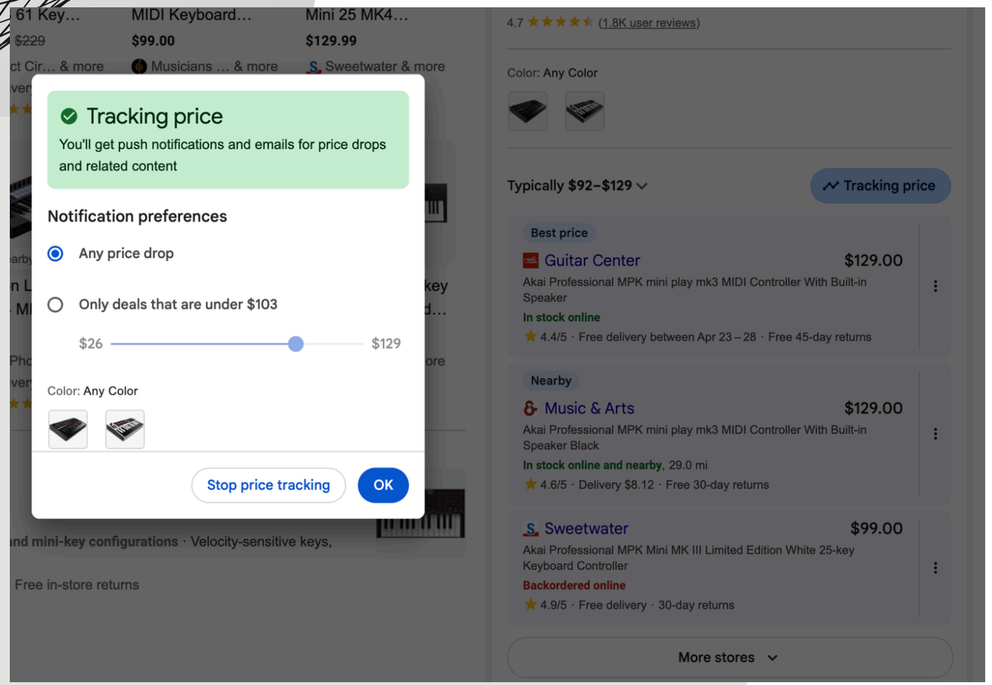
Problem: lack of legal web scrapping methodology

Pivot: 2D to 3D visualization for e-commerce purchasing

MVP: dorm visualization for incoming students planning online purchases

Next Steps: Unlocking AWS credits, testing models, building MVP

Problem With Old Model



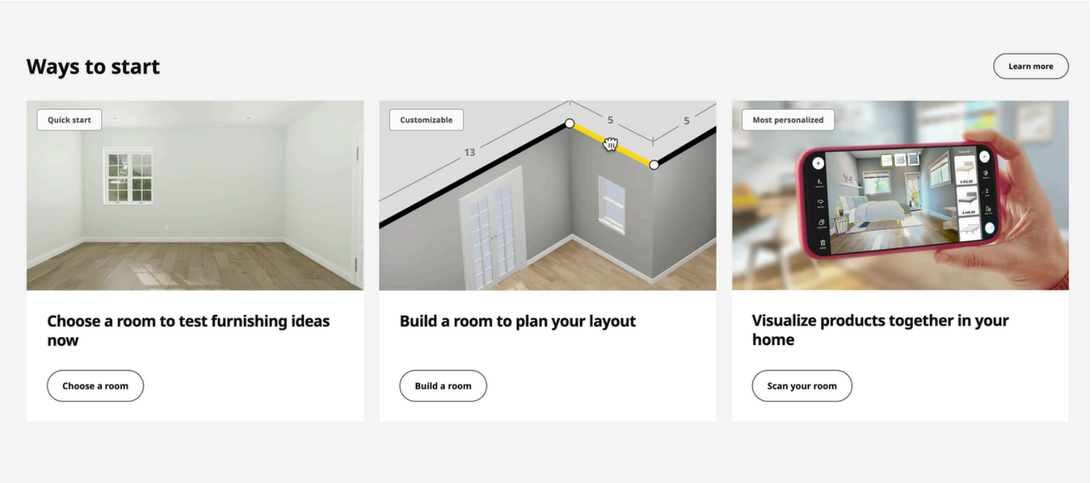
Terms and Conditions → no legal work around to legally scraping to keep a large bank updated

Meeting with YC Partner → Harshita Arora emphasis the importance of the database bank

Google Price Tracking → new price tracking feature released by google

New Focus

- Visualizing 2D objects into the 3D living space
- Cutting edge research of convering 2D to 3D visualization tools → lots being done at uchicago directly with Rana hanoka's lab
- solves the problems of limiting returns
- Similar to ikea visualizatoin but with AI object creation, envrionemnt modeling , and interactive visualization.



Who we've met with

Lucy Brenna
- Head of AI in Careers
- Local Chicago resources
- Reaching out to people in Industry for mentors

Professor Michael Maire
- Introduced to Neural radiance field (NeRFs)
- highlight importance of compute
- talk to Rana(**?**)
- Faculty members: TTIC Greg and Sherry
- PHD students: Will Gao

UChicago Housing
- Starting communication for MVP
- They are busy with move outs right now
- Will reach back out

Why This Problem

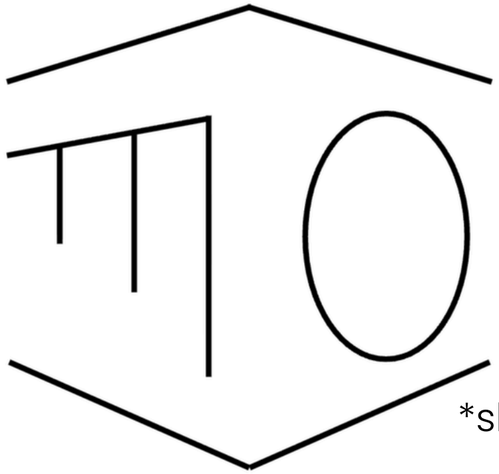
- **Yanis:** Experienced app developer, mainly worked with LLM AI in the past, interested in expanding visual realm
- **Aeliya:** Interested in the realm of technology and graphics, interned with Akool studying image to video generation, and studied computer graphis and computer vision in classes taught by Rana Hanoca and Michael Maire.
- **Fyodor:** Engineering background, interested in bridging gap between visual AI capabilities and real-world applications, especially how these tools can move from isolated demos into integrated, practical everyday uses.

Product Stages

- 2D → 3D generation
  - train a convolutional network based on current research papers to map 2D images into a 3D point cloud or neural radiance field using AWS credits / google cloud using the imagenet 3D training data set
  - or using and fine tuning open source models TripoSR or Trellis
  - Papers
- 3D Placement in virtual environemnt
  - customizing rules with fixed 3D furnature.
  - Similar to Ikea set up but also adding in your custom 3D generated objects.
- 3D visualization in physical environment
  - When object is placed in virtual world, map to physical world to be able to physically walk and view structures as if physically in the real world.

Name and Logo

- 2D to 3D → Two To Three → TTTo
  - Two: TT
  - To: To
  - Three: TTT
- Toova
  - Tool
  - VA → experienced virtual assistant



*sketch

Next Steps

- Determining data structures and data flow
- Build out MVP → will have first draft done by May 17th (end of UnCommon Hacks hacakthon)
- Unlocking AWS credits (1 yr cursor pro already claimed)
- Unlocking and learning YC Student deal packages as relevant

Questions

Presented by Liceria Group
